

Project Requirement Analysis

After defining the problem, I broke the solution into the main things an employee and a support user would need. The focus is to keep the first version simple enough to use, while still storing the information needed for follow-up.

Functional Requirements

Non-Functional Requirements

Simple user experience so an employee can understand the form without technical knowledge.

Role-based access should be respected through ServiceNow application and security settings.

Records should be stored in a structured custom table so they can be searched and reported later.

The solution should be maintainable using standard ServiceNow configuration wherever possible.

The portal page and form should remain usable on normal desktop browser sizes.

Expected Result

The expected result is a working ServiceNow flow in which an employee opens the portal, chooses Raise Employee Issue, enters the required information, submits the request, and gets a corresponding backend record for support processing.

Tables and Structured Information

Date		Team ID	
Project Name	Employee Raise Issue – ServiceNow	Maximum Marks	

ID	Requirement
FR1	Employees should be able to open a Raise Employee Issue form from the Service Portal.
FR2	The form should capture the requester, category, subcategory, short description and issue state.
FR3	Employees should be able to add an attachment when supporting information is required.
FR4	The submission should create a record in the Employee Raise Issue table.
FR5	The system should keep the generated record number read-only for the user.
FR6	When the state is New, the short description should be mandatory.
FR7	The issue should contain assignment and priority information so that it can be handled by the support team.
FR8	The employee-facing experience should be available through the Service Portal.
