

Problem – Solution Fit

The proposed solution fits the problem because it replaces scattered employee requests with one standard ServiceNow entry point. A Record Producer is used so employees can submit an issue without directly working with the backend table.

How the Solution Addresses the Problem

Technology Stack (Architecture & Stack)

The project uses ServiceNow as the main platform, so the application, data layer and employee-facing experience are kept inside the platform. This avoids building a separate web application for the first version.

Technical Architecture

Employee → Service Portal → Record Producer → Employee Raise Issue table → Support/assignment workflow

Table 1 – Components & Technologies

Table 2 – Application Characteristics

Tables and Structured Information

Date		Team ID	
Project Name	Employee Raise Issue – ServiceNow	Maximum Marks	4 Marks

Problem area	ServiceNow response
Employee request	A single Raise Employee Issue form gives employees a consistent starting point.
Structured information	Category, subcategory, requester, description, state and other fields keep the request organized.
Validation	UI Policies help enforce useful form behaviour, such as requiring a short description when the state is New.
Tracking	Every submission becomes a record in the Employee Raise Issue table and can be followed by the support team.
Portal access	The Service Portal provides an employee-friendly front end instead of exposing the backend table.

Component	Technology / Choice
UI	ServiceNow Service Portal and catalog item / Record Producer form
Application logic	ServiceNow configuration, UI Policies and Client Scripts
Database	ServiceNow platform database using the custom Employee Raise Issue table
Cloud DB	ServiceNow-managed platform data layer
File storage	ServiceNow attachments
External APIs	Not required for the current version
ML model	Not used; this is an enterprise workflow application
Infrastructure	ServiceNow cloud platform

Characteristic	Approach
Open-source frameworks	No separate open-source application framework is required.
Security	ServiceNow application scope and access controls are used.
Scalable architecture	Uses the ServiceNow platform rather than a custom standalone server.
Availability	Relies on ServiceNow platform availability.
Performance	Keeps the employee form and backend data model focused on the required issue workflow.
