

Implementation Summary

The application was built in ServiceNow using the Employee Center scoped application. The main backend table is Employee Raise Issue, and the employee-facing submission is provided through the Raise Employee Issue Record Producer and Service Portal.

Implemented Configuration

- Employee Center custom application created.
- Employee Raise Issue custom table created with issue-related fields.
- UI Policy created to keep the Number field read-only.
- UI Policy created to make Short description mandatory when State is New.
- Raise Employee Issue Record Producer configured for employee submissions.
- Employee Request Service Portal page includes a Raise an Issue entry point.

Application Testing Approach

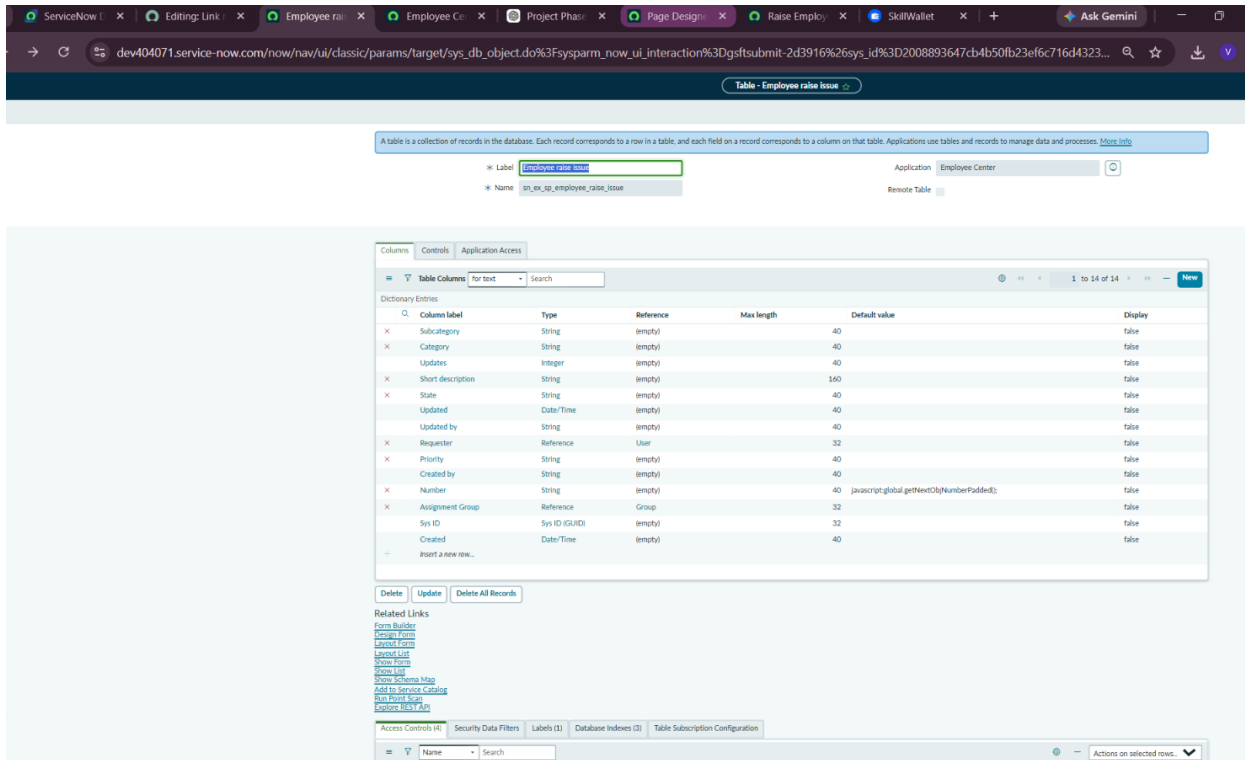

Because this project is a ServiceNow workflow application rather than a machine-learning model, model accuracy metrics from the supplied development template do not apply. Testing is therefore focused on whether the configured application behaves as intended.

Evidence 1 — Employee Center Application

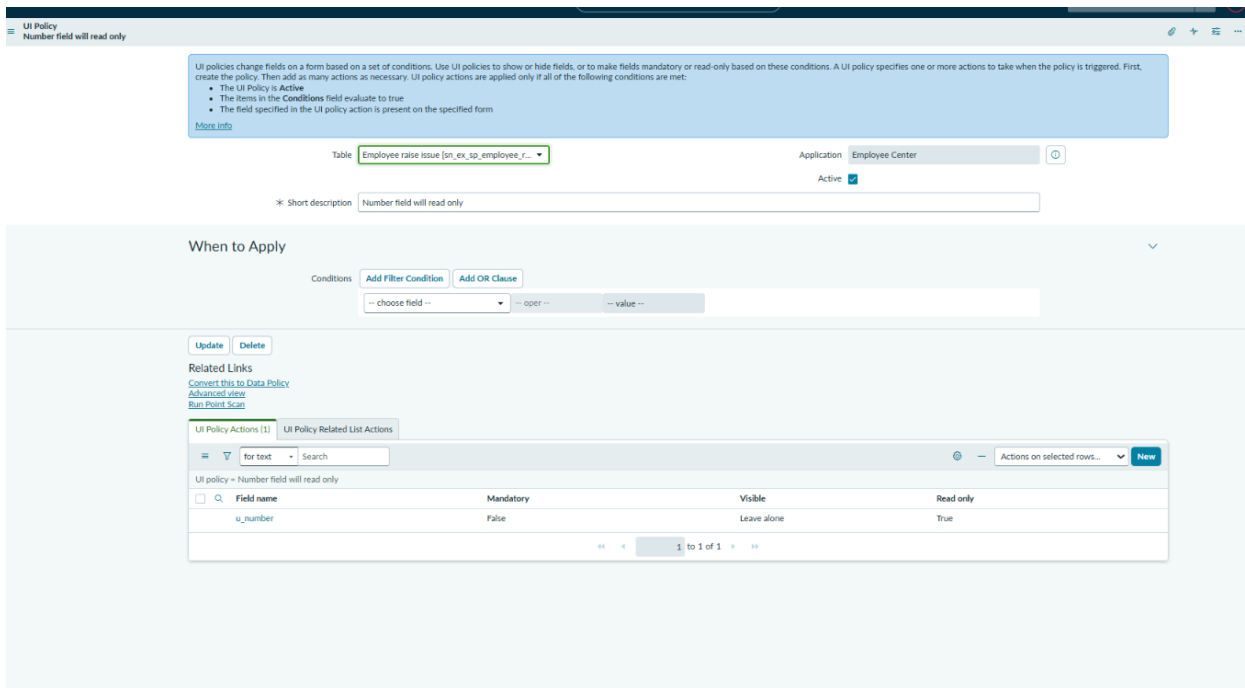

Shows the custom Employee Center application and its scoped application details.

Evidence 2 — Employee Raise Issue Table

Shows the custom table, its application, and the configured columns.

Evidence 3 — Number Field Read-Only UI Policy

Shows the active policy and its action making the Number field read-only.

Evidence 4 — Short Description Mandatory UI Policy

UI policies change fields on a form based on a set of conditions. Use UI policies to show or hide fields, or to make fields mandatory or read-only based on these conditions. A UI policy specifies one or more actions to take when the policy is triggered. First, create the policy. Then add as many actions as necessary. UI policy actions are applied only if all of the following conditions are met:

- The UI Policy is Active
- The items in the Conditions field evaluate to true
- The field specified in the UI policy action is present on the specified form
